National Hydrography Dataset (NHD)

Water network for mapping and modeling

- The drainage network with features such as rivers, streams, canals, lakes, ponds, and stream gages

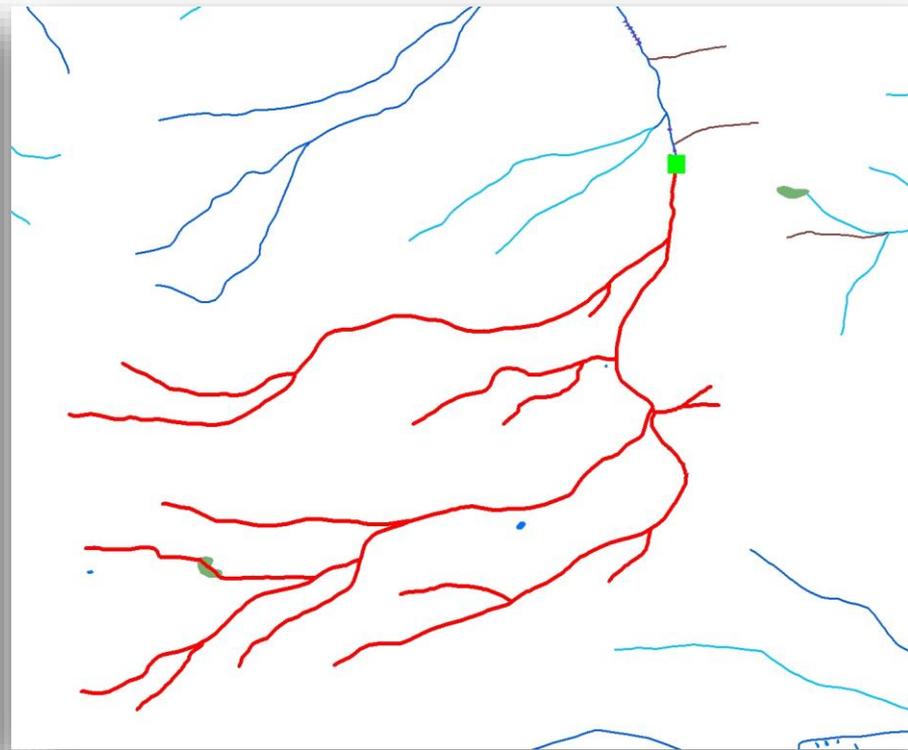

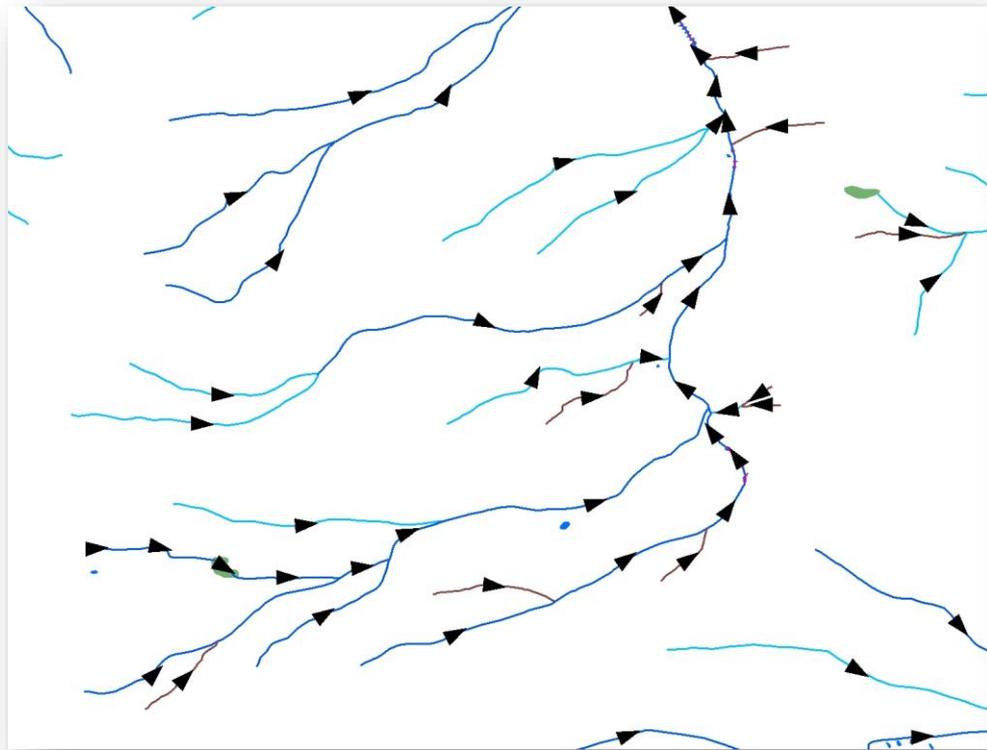

+ Flow Direction

A key piece of intelligence

Navigation

The basis for analysis

Values to NHD Linkage

- Provides a nationally consistent geospatial framework
- Provides network tools and information
- Creates collaborative opportunities to share information across projects and agencies

USGS, Jeff Duda

Values to NHD Linkage

- Provides a nationally consistent framework
- Provides a common language for projects and agencies

**QUICK INTEGRATION
OF INFORMATION!!!**

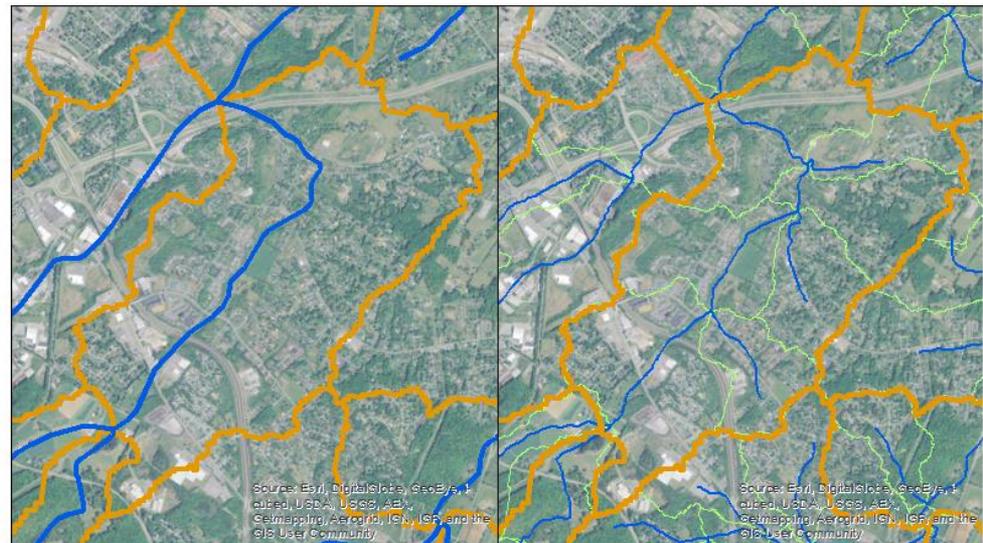

USGS, Jeff Duda

+ NHDPlus HR Applications

The power of a common hydrography framework

- Enables complex models such as the National Water Model to bring flood forecasting down to the neighborhood level
- Observational data can be linked to NHDPlus HR to supporting limitless applications such as:

Comparison of medium (1:100,000, left) and high (1:24,000, right) resolution NHDPlus. Blue lines represent the stream network. Orange lines delineate medium-resolution catchments and green lines are catchments of the streams added at the higher resolution.

- Predicting the risk, timing, and magnitude of flood events
- Estimating when and where an event such as a toxic spill will affect downstream populations and ecosystems
- Enabling property owners to better understand upstream water availability impacts

Values of NHD Linkage: Flow Modeling Example

Natural Stream Flow Estimates for Washington Using the NHDPlus Unit Runoff Method

Purpose

This map presents the methodology and results of the NHDPlus Unit Runoff Method (UROM) calculations for modeling natural streamflow in Washington. The map does not represent actual streamflow, but rather modeled streamflow based on the UROM model. The intent of the map is to show the characteristics of Washington's drainage network and how the tributary system converges into larger and larger arteries to form the major rivers that drain the state. By reviewing this drainage pattern it is possible to better understand Washington's drainage.

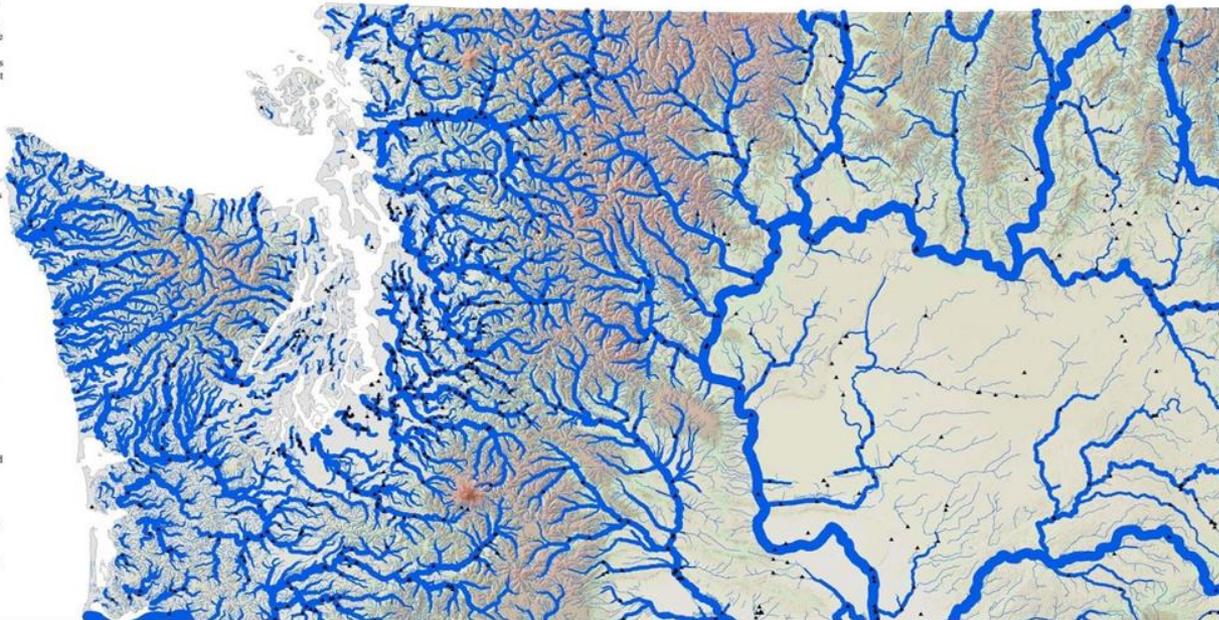

The Map

The stream lines come from NHDPlus, a joint U.S. Environmental Protection Agency (USEPA)-U.S. Geological Survey (USGS) program to develop enhancements to the 1:100,000-scale National Hydrography Dataset. The line weights represent ranges in mean annual streamflow measured in cubic feet per second (cfs). Streams with a UROM streamflow less than 1.0 cfs are not shown. This eliminates approximately half of the 1:100,000-scale streams from being shown and results in good map clarity at the map scale of 1:767,000 (as shown).

NHDPlus

NHDPlus is an integrated suite of application-ready geospatial data sets that incorporates many of the best features of the National Hydrography Dataset (NHD), and National Elevation Dataset (NED). NHDPlus includes a stream network based on the medium resolution NHD, improved networking, name attributes, and "value-added attributes" (VAA's) providing additional flowline characteristics. Flowlines are the basic linear hydrologic features in the NHD, such as streams, rivers, etc. NHDPlus also includes elevation-derived catchments (flowline-based drainage areas) produced using a drainage enforcement technique dubbed "The New-England Method". This technique modifies the National Elevation Dataset (NED) by "burning-in" the 1:100,000-scale NHD, and when available, building "walls" using the national Watershed Boundary Dataset (WBD). The resulting modified Digital Elevation Model (DEM) is used to produce hydrologic derivatives that agree with the NHD and WBD. Over two years an interdisciplinary team from the USGS and USEPA found this method to produce the best quality catchments feasible in a relatively short time frame.

Unit Runoff Method

UROM Calculations

Using streamflow data from the selected gages, mean annual and mean summer unit runoff ($\text{ft}^3/\text{sec}/\text{km}^2$) were calculated for each subbasin. The nearest HCDN gages were identified using a 200-mile maximum search radius from the centroid of a subbasin. In most subbasins, five gages were selected but some had fewer than five within the 200-mile search radius. Mean annual and mean summer unit runoffs for each subbasin were calculated using a weighted-average technique based on the square of the distance of the selected HCDN gages from the centroid of the subbasin. The computations are defined as follows:

$$Q_{CU,MA} = \frac{\sum(Q_{HCDN,MA} \times D^2_{CU,HCDN})}{\sum(D^2_{CU,HCDN})}$$

Where
 $Q_{CU,MA}$ = estimated mean annual unit discharge for the 8-digit subbasin of interest,
 $Q_{HCDN,MA}$ = mean annual unit discharge for the selected HCDN gages,
 $D^2_{CU,HCDN}$ = square of distance from the selected HCDN gage to the centroid of the 8-digit subbasin of interest.

Flows for each NHDPlus flowline were then calculated as follows:
 IncrFlowU is the incremental flow at the bottom of flowline, computed as:

$$\text{IncrFlowU} = A \times CU_{MA}$$

Where
 A = Drainage Area of the catchment (km^2), and
 CU_{MA} = Unit Runoff for the 8-digit Subbasin (cfs/km^2)

The UROM based mean annual flow for each flowline, MAFlowU is computed as:

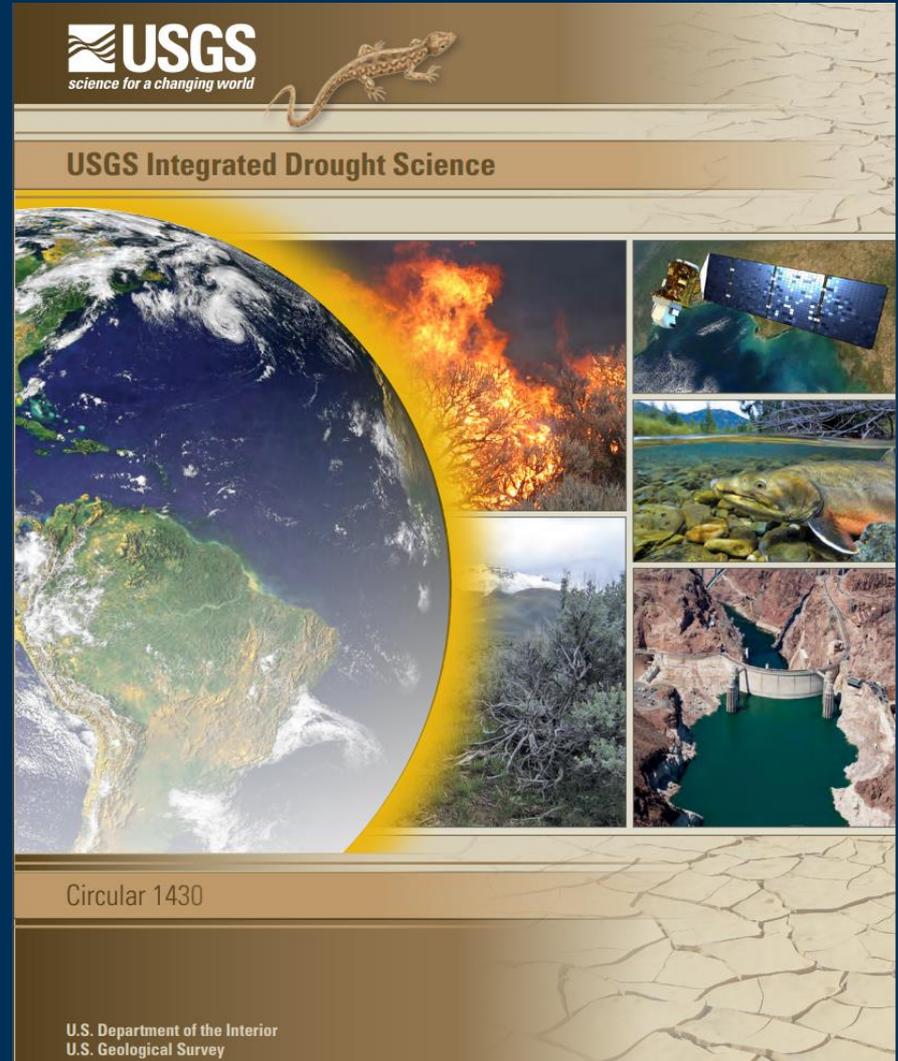

$$\text{MAFlowU} = \sum_{i=1}^n (\text{IncrFlowU}_i) \text{ for } i = 1 \text{ to } n \text{ upstream flowline.}$$

UROM Tuning Using Intermittent Flow Adjustment Factors

The UROM was developed as part of the National Water Pollution Control Assessment Model (NWPCAM) (Research Triangle Institute, 2001). For hydrologic regions west of the Mississippi, initial UROM estimates of routed discharge generally were observed to be greater than the HCDN gage flow values. Consequently, for the western hydrologic regions, a method was developed to better relate discharge estimates to observed flow data. The discharge estimates were lowered (tuned) by incorporating only a percentage of the reach-specific runoff for intermittent stream reaches. The method calculates discharge estimates assuming various contributions (e.g., 100, 50, 25, 10, and 1 percent) of the

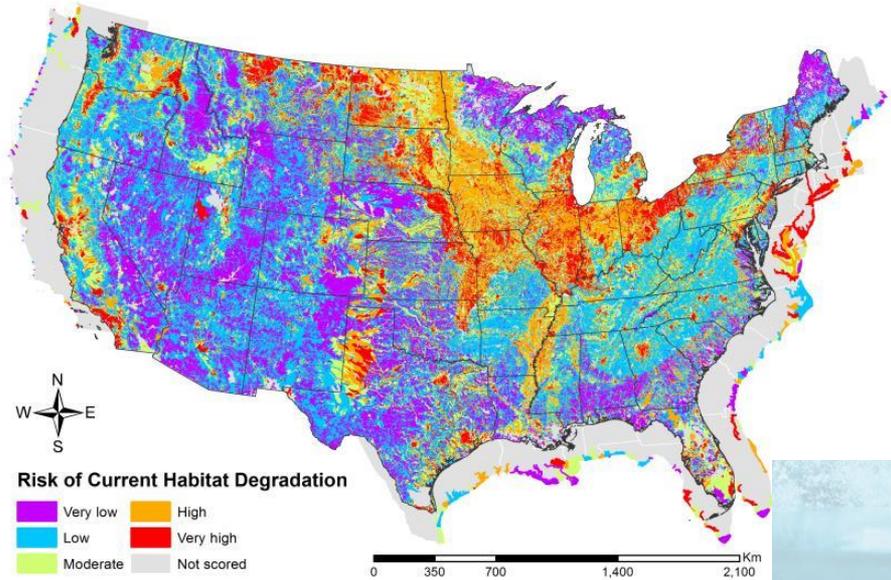

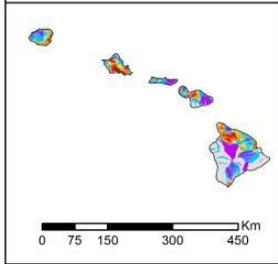

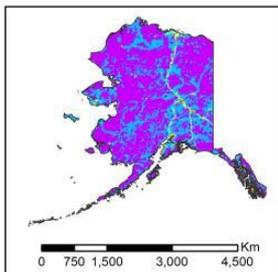

Values of NHD Linkage: USGS Drought Science Plan

“A common framework is essential for linking information among USGS programs concerning streamflow, groundwater, and water quality; climate and land use; ecosystems; and geospatial mapping.”

NATIONAL FISH HABITAT PARTNERSHIP

National Assessment of Fish Habitats

THROUGH A FISH'S EYE: THE STATUS OF FISH HABITATS IN THE UNITED STATES 2015

This report summarizes the results of an unprecedented nationwide assessment of human effects on fish habitat in the rivers and estuaries of the United States. The assessment assigns a risk of current habitat degradation scores for watersheds and estuaries across the nation and within 14 sub-regions. The results also identify some of the major sources of habitat degradation.

NHDPlus MR (1:100,000)

Comparison of Current NHD Versions

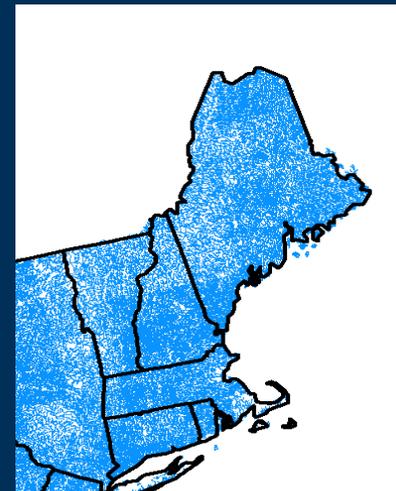

NHD High Resolution

- 1:24,000 scale or better, except Alaska 1:63,360 scale)
- Regional or local studies/models
- Catchments in Development
- 26 million flowlines for U.S., including Alaska, Hawaii and Territories
- Maintained

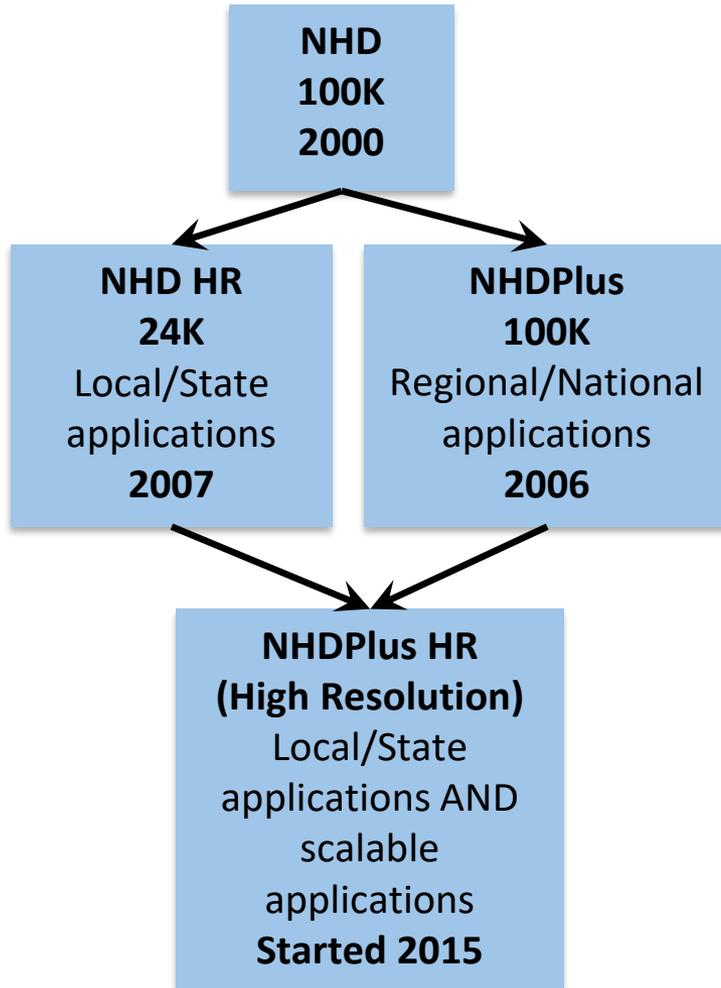

NHD Medium Resolution

- 1:100,000 scale
- Basis of NHDPlus V1 & V2
- Regional and national studies/models
- ~2.7 million flowlines for Conterminous U.S.
- Not available in Alaska
- Local Catchments
- Value Added Attributes
- Static

+ Evolution of NHDPlus HR

Taking NHDPlus v2 (Med Res) to a new level

- The best of NHDPlus and NHD HR (24K or better) data
- Addresses the need for a single hydrographic frame of reference
- Link data to one network and generalize to many different scales

+ USGS National Hydrography Datasets

Hydrologic networks, units, catchments, and more...

National Hydrography Dataset (NHD)

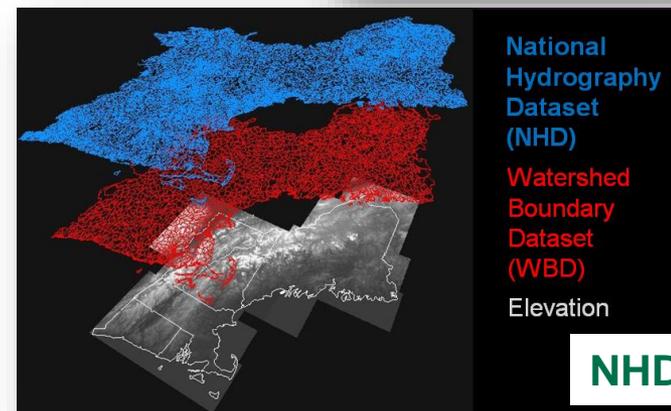

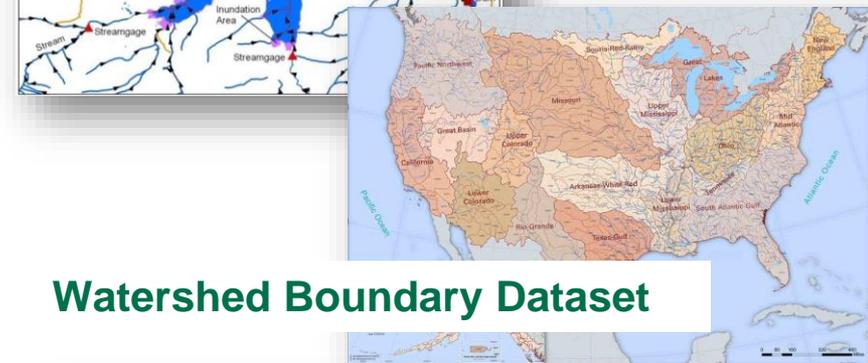

- The drainage network with features such as rivers, streams, canals, lakes, ponds, and stream gages

Watershed Boundary Dataset (WBD)

- The drainage basins at 8 scales of a nested hierarchy; defines the areal extent of surface water drainage to a point

NHDPlus

- Incorporates features of the NHD, WBD and 3DEP elevation data to create a networked hydrography framework that incorporates the entire landscape

NHDPlus

+ NHDPlus Data Comparison

Medium Resolution versus High Resolution

	NHDPlus Medium Resolution (V2)	NHDPlus High Resolution
Number of catchments	~2.7 Million nationally	~26 Million nationally
Elevation Input	National 1 Arc-Second Seamless DEM (30 meters)	National 1/3 Arc-Second Seamless DEM from 3DEP (10 meters)
NHD Input	Medium Resolution NHD 1:100K	High Resolution NHD 1:24K or better
WBD Input	Composite 2010-2012	Updated WBD
Catchment size	Avg. 1.2 square miles	Avg. ~0.2 square miles
Flow estimates	Mean annual, mean monthly	Mean annual

+ NHDPlus includes...

- A nationally seamless network of stream reaches
- Value-added attributes for stream network navigation and analysis
- Flow surfaces in raster format
- Elevation-based catchment areas for each stream segment that
 - Create a seamless, scalable hydrologic framework
 - Enable modeling of water flow across the landscape, linking terrestrial characteristics to the stream network

+ NHDPlus High Resolution

NHD Plus HR

- The Hydrography Requirements and Benefits Study: ~ 80% of users need the functionality of NHDPlus but ***at a higher resolution***
- USGS is building NHDPlus HR from the highest available resolution NHD and WBD data, and 10m 3DEP data
- The results are more accurate and better maintained than the current, medium resolution NHDPlus
- NHDPlus HR will have multi-scale representation capabilities with the new VisibilityFilter attribute

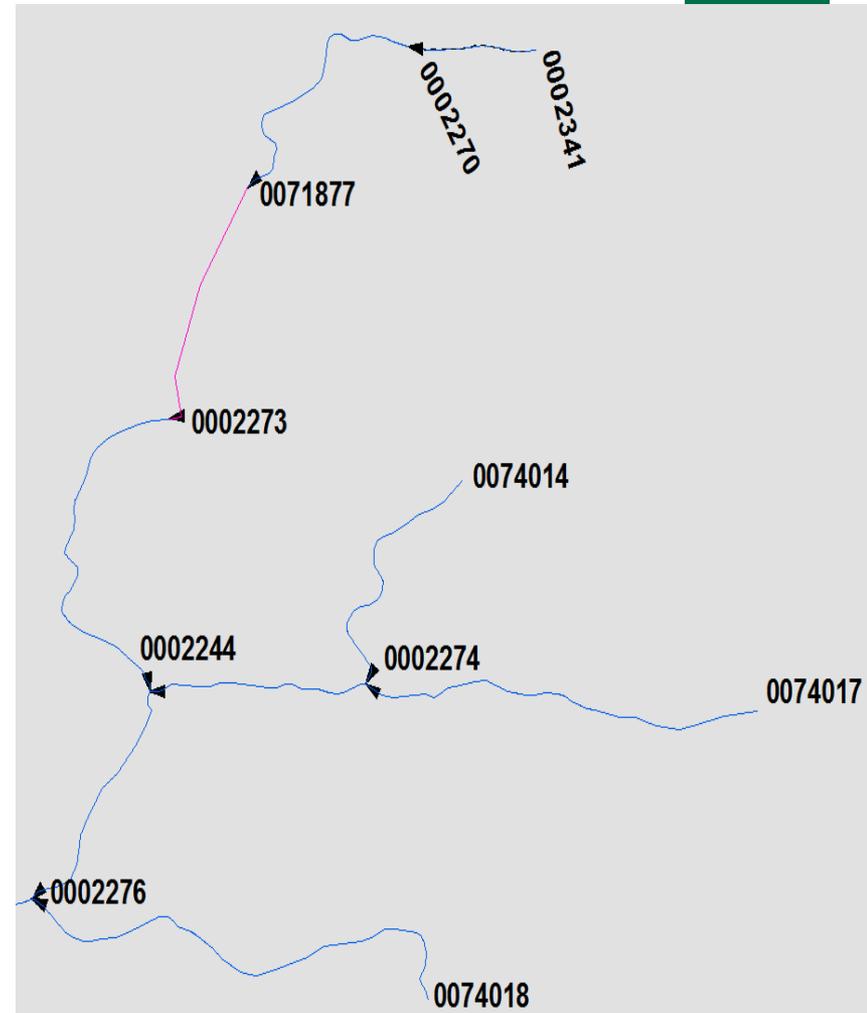

NHDPlus Value Added Attributes (VAAs)

From node/To node

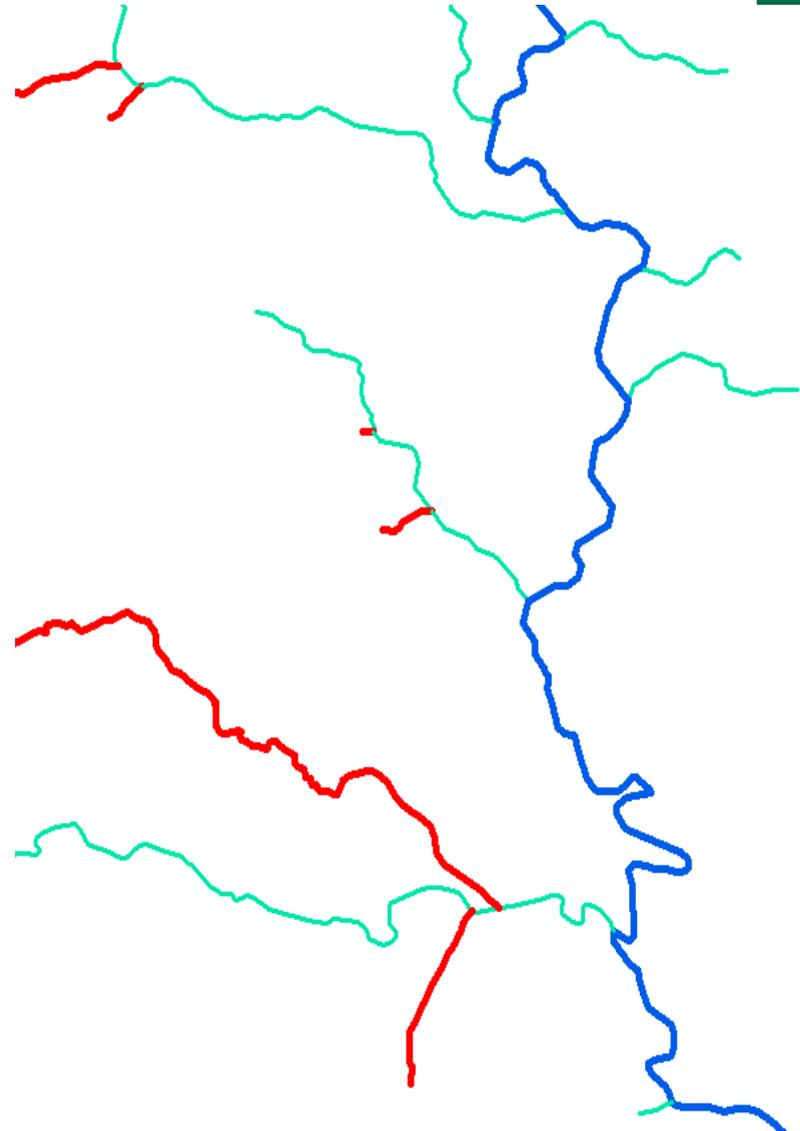

- A set of nationally unique identifiers for the node endpoints of the flowlines
- This supports the many models that use linked node navigation

NHDPlus Value Added Attributes (VAAs)

StreamLevel

- Provides the information necessary to determine the main path upstream at each confluence
 - **Blue** = StreamLevel 1
 - **Green** = StreamLevel 2
 - **Red** = StreamLevel 3
- This supports upstream navigation of a river mainstem

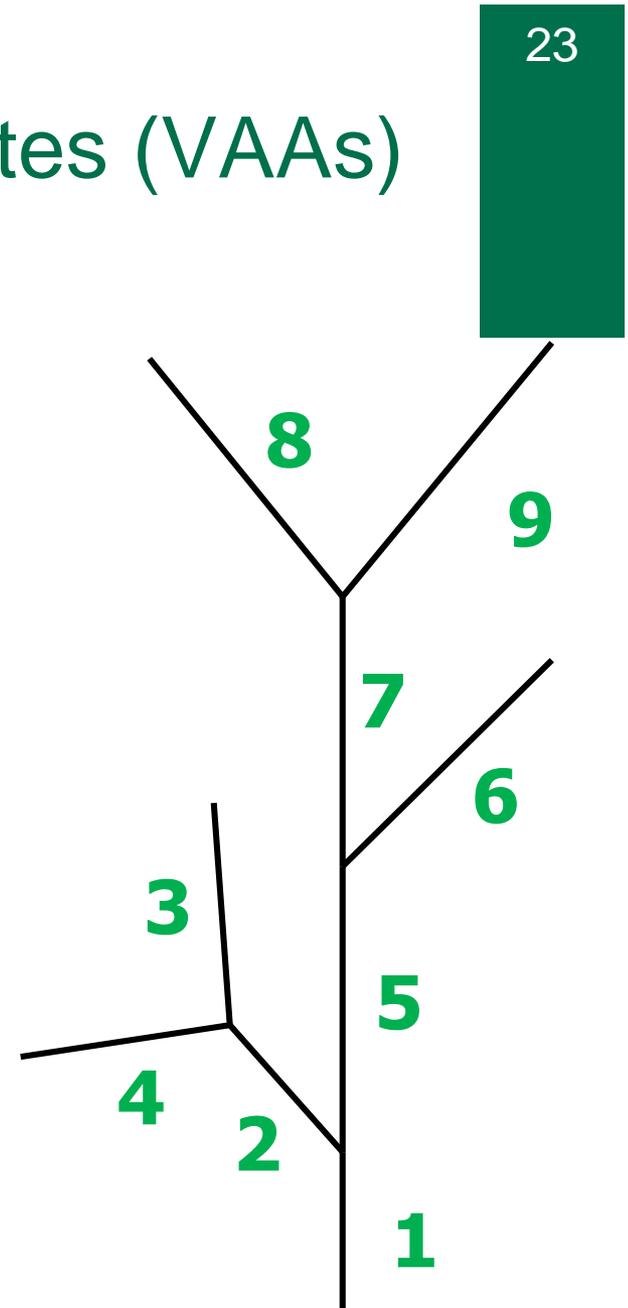

+

NHDPlus Value Added Attributes (VAAs)

Hydrologic Sequence Number (HydroSeq)

- A nationally unique sequence number that places NHD flowline features in hydrologic sequence
 - Ascending = downstream to up
 - Descending = upstream to down
- Enables models to process the network in a tabular manner without using geometry flowlines

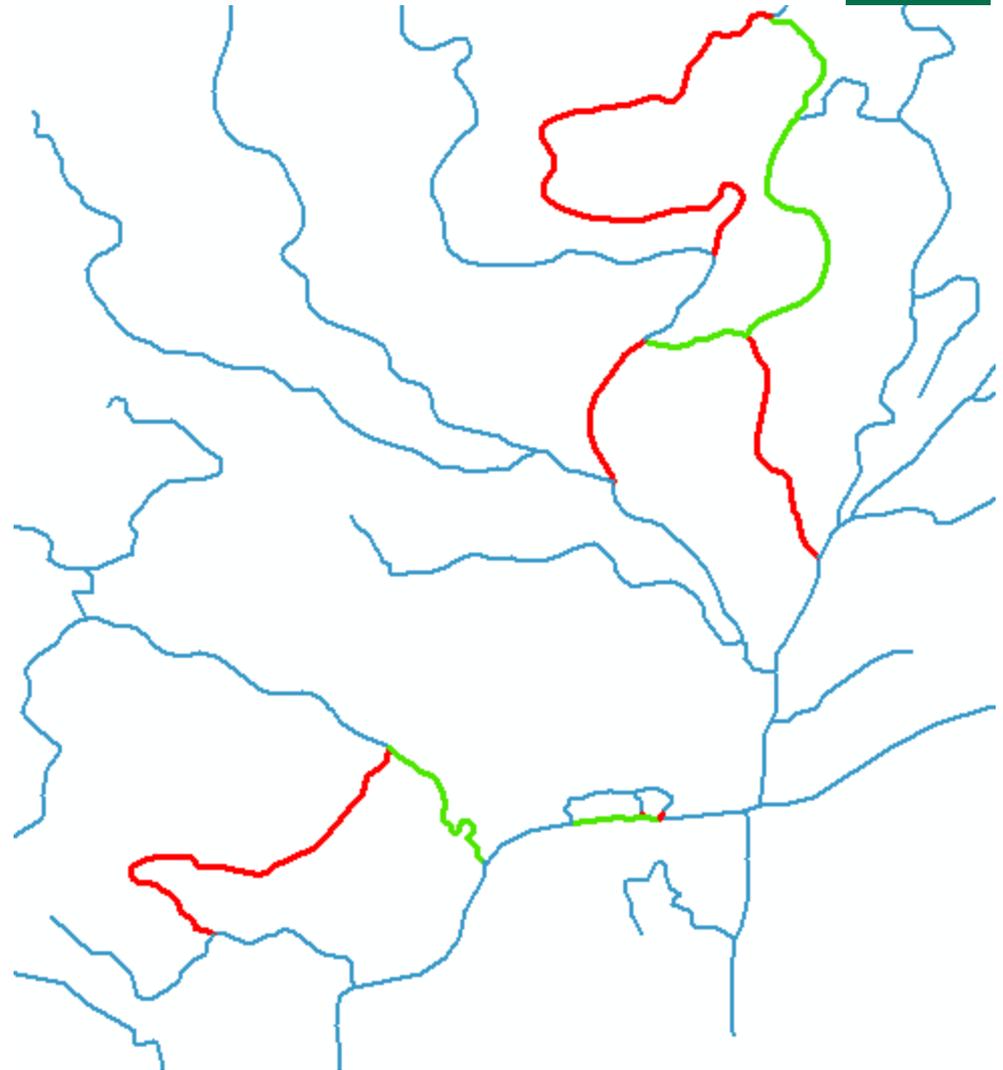

NHDPlus Value Added Attributes (VAAs)

Divergence

- A flag which defines the major and minor branches of a flow split (divergence)
- This supports downstream navigation of the network mainstem

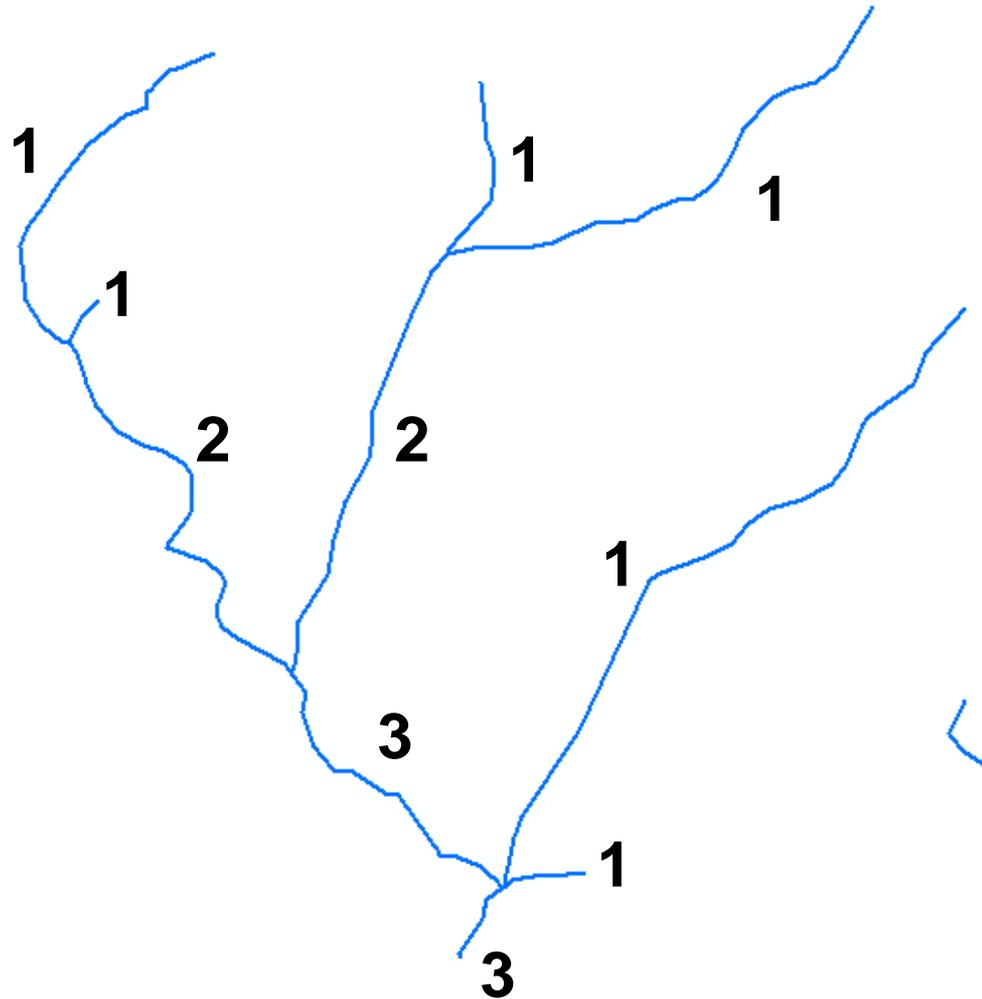

+

NHDPlus Value Added Attributes (VAAs)

Strahler Stream Order

- A surrogate for stream size
- A popular analysis attribute.

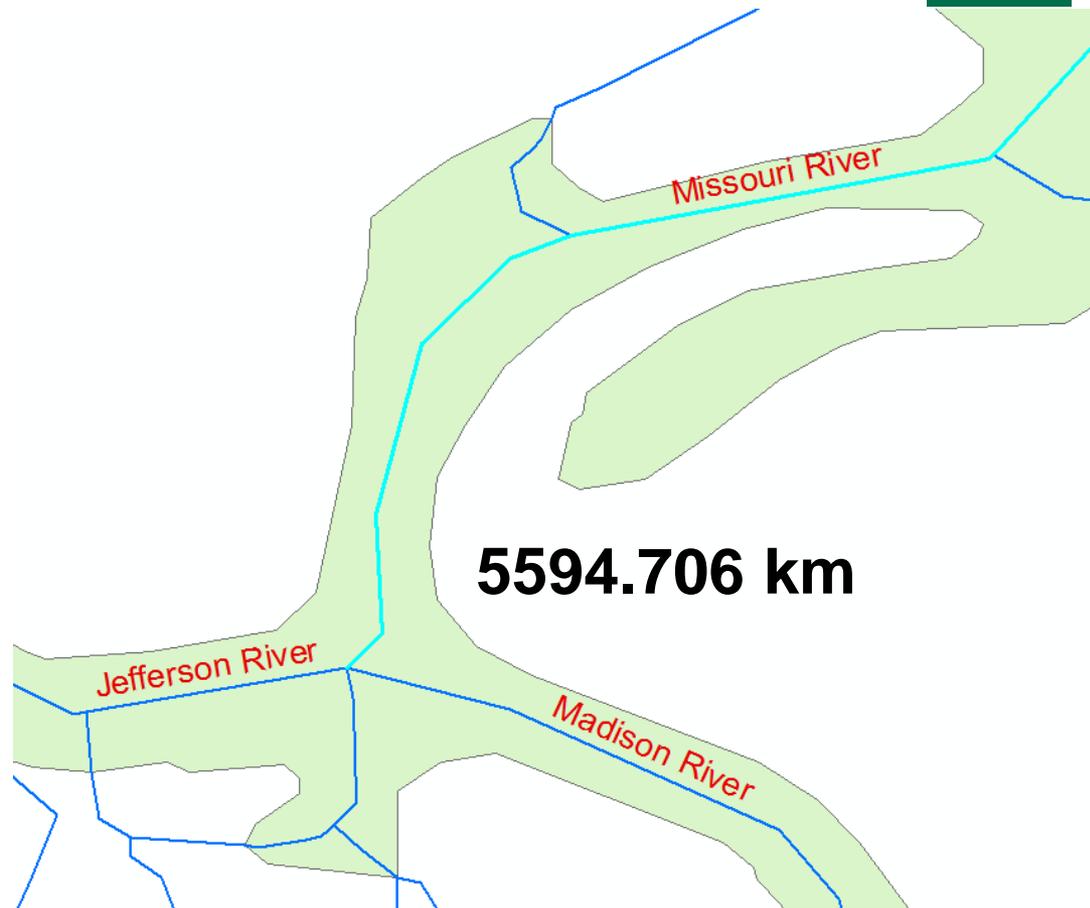

+

NHDPlus Value Added Attributes (VAAs)

PathLength

- The distance downstream to the network terminus

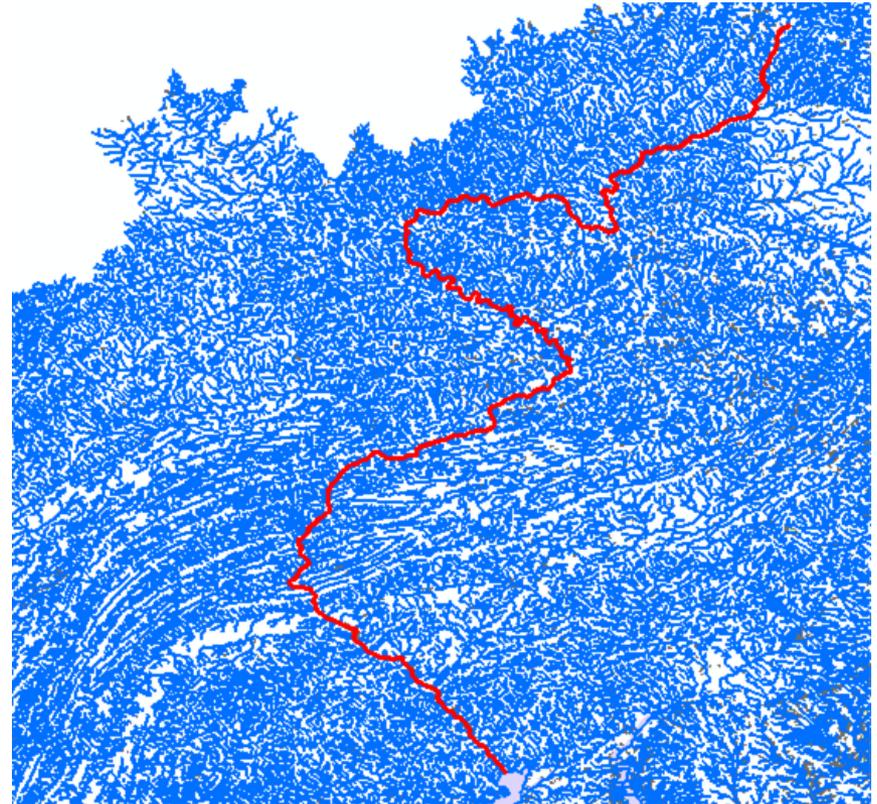

+

NHDPlus Value Added Attributes (VAAs)

Level Path Identifier

- The identifier (HydroSeq) for all the flowlines on a level path from mouth to headwaters
- River Main Stem

+

NHDPlus Value Added Attributes (VAAs)

Terminal Identifier

- The identifier (HydroSeq) for the terminal flowline in this network

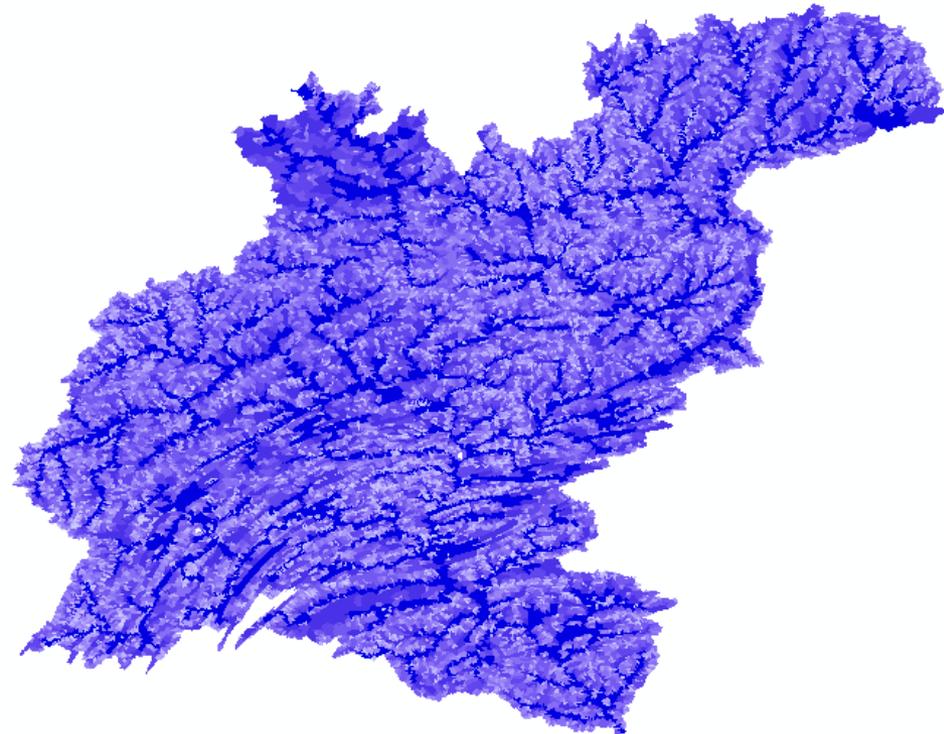

+

NHDPlus Value Added Attributes (VAAs)

Total Upstream Drainage Network

- A simple select to identify the upstream drainage network

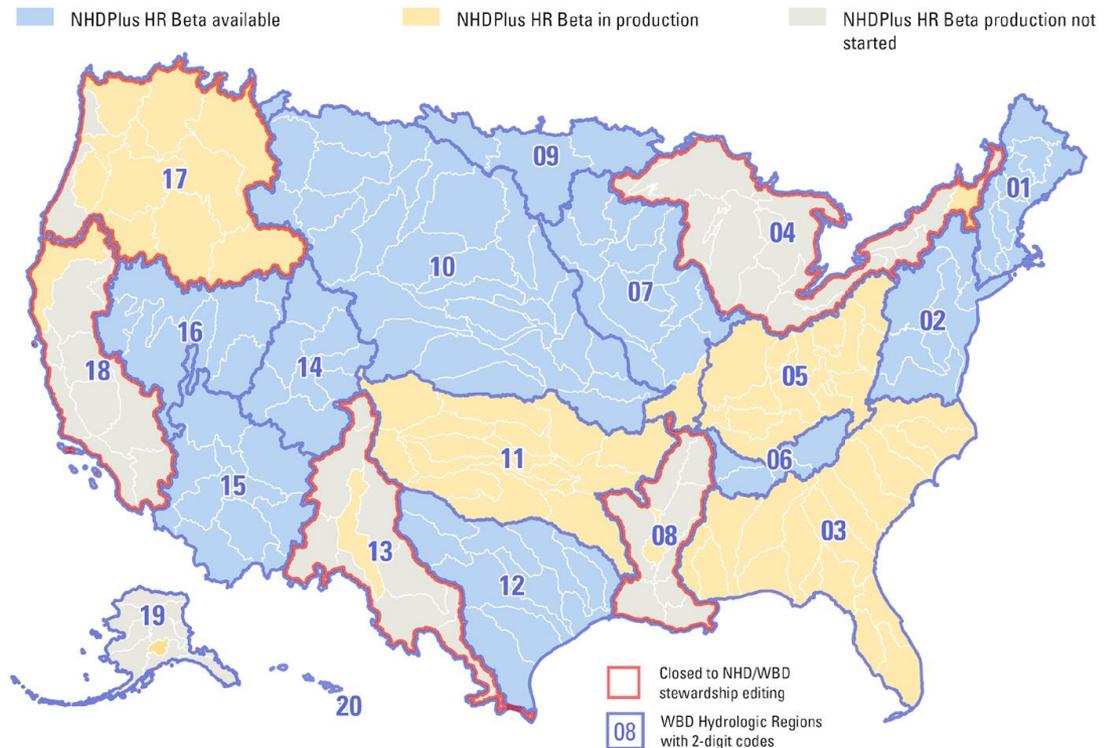

+ NHDPlus HR Status

First datasets released in April, 2017

- NHDPlus HR Beta will be completed in 2019 for the conterminous U.S., followed by AK, HI, and territories in later years
- Users are invited to review and provide feedback to the Beta version datasets
- Feedback will be used to update and improve the refreshed data release, beginning in 2018

Links to Data Products and Map Services

The [NHDPlus High Resolution \(NHDPlus HR\)](#), [National Hydrography Dataset \(NHD\)](#), and [Watershed Boundary Dataset \(WBD\)](#) are available for download and as map services. All NHDPlus HR downloads contain a copy of the NHD and WBD datasets used to create the NHDPlus HR. The copies are current only to the date the NHDPlus HR was created. All NHD downloads contain a copy of the corresponding WBD dataset that is current only to the date the NHD dataset was created.

Department of the Interior (DOI) users may experience faster download times when using the "DOI users" link.

Downloads

The National Map Download Viewer

The [National Map Download viewer](#) provides an online mapping tool for downloading the NHDPlus HR, NHD and WBD as a shapefile or file geodatabase by [Hydrologic Unit \(HU\)](#), including Subregion (HU4) or Subbasin (HU8), by state, or nationally. A [Download Manager](#) application also is available for conveniently managing downloads of multiple datasets.

NHDPlus High Resolution (NHDPlus HR) Direct Download Links

Please note: The NHDPlus High Resolution is being released for download in Beta version (NHDPlus HR Beta) by Subregion (HU4) as it is built. Please see the [NHDPlus High Resolution \(NHDPlus HR\)](#) page for more information about this building process, to find out the current availability by Hydrologic Region, and to learn about participating in reviews of the Beta version data.

The NHDPlus HR data includes both vector and raster components for each geographic area mapped. NHDPlus HR Beta vector data is available in file geodatabase (GDB) format, zipped (.zip) to reduce the file size. NHDPlus HR raster data files are available for download as zipped (.7z) files.

- [Download the NHDPlus HR by Subregion \(HU4\) \(DOI users\)](#)

National Hydrography Dataset (NHD) Direct Download Links

The NHD High Resolution can be directly downloaded in shapefile or file geodatabase (GDB) format by [Hydrologic Unit \(HU\)](#), state, or the entire nation. Also, an extract containing only streamgages and dams is available.

- [Download the NHD by Subregion \(HU4\) \(DOI users\)](#)
- [Download the NHD by Subbasin \(HU8\) \(DOI users\)](#)
- [Download the NHD by State \(DOI users\)](#)
- [Download the NHD by the entire nation \(DOI users\)](#)
- [Download streamgages and Dams only \(DOI users\)](#)

Watershed Boundary Dataset (WBD) Direct Download Links

The WBD can be directly downloaded in shapefile or file geodatabase format by [Hydrologic Unit](#) - Region (HU2) - or as a file geodatabase for the entire nation.

- [Download the WBD by Region \(HU2\) \(DOI users\)](#)
- [Download the WBD by the entire nation \(DOI users\)](#)

National data are refreshed monthly.

- [Download the WBD from the NRCS Geospatial Data Gateway](#)

Watershed Boundaries can also be downloaded from the Natural Resources Conservation Service. Data on the Geospatial Data Gateway are refreshed every six months (March and September).

Map Services

+ Access the Data: NHD High Resolution Web-Based Map Services

The screenshot shows a web browser window with the URL <https://nhd.usgs.gov/data.html>. The page title is "Watershed Boundary Dataset (WBD) Direct Download Links". The content includes a section for "Map Services" which is highlighted with a red box. Below this section is a table with columns: Full Name, Service Name, Category, Type, Data, Scale, and Update. The table lists three services: Hydrography - Cached (Tiled), National Hydrography Dataset, and Watershed Boundary Dataset. Below the table is a section titled "Which service should I use?" with three bullet points explaining each service. At the bottom of the page, there is a footer with navigation links and contact information.

Watershed Boundary Dataset (WBD) Direct Download Links

The WBD can be directly downloaded in shapefile or file geodatabase format by [Hydrologic Unit - Region \(HU2\)](#) - or as a file geodatabase for the entire nation.

- [Download the WBD by Region \(HU2\) \(DOI users\)](#)
- [Download the WBD by the entire nation \(DOI users\)](#)
National data are refreshed monthly.
- [Download the WBD from the NRCS Geospatial Data Gateway](#)
Watershed Boundaries can also be downloaded from the Natural Resources Conservation Service. Data on the Geospatial Data Gateway are refreshed every six months (March and September).

Map Services

Hydrography web-based map services are available from [The National Map Service Endpoints](#) page as cached and dynamic services.

On occasion, maintenance will be performed on these map services causing limited access. Contact nhd@usgs.gov if you encounter service-related issues or need assistance with these services.

Full Name	Service Name	Category	Type	Data	Scale	Update
Hydrography - Cached (Tiled)	USGSHydroCached	Base Maps and/or Overlay	Raster Tile Cache	NHD High Resolution	Down to 9K (Level 17 in Google map tiles)	Annual
National Hydrography Dataset	NHD	Theme Overlays	Dynamic	NHD High Resolution	1:288K and larger	Quarterly
Watershed Boundary Dataset	WBD	Theme Overlays	Dynamic	WBD	1:18M and larger	Quarterly

Which service should I use?

- **Hydrography - Cached (Tiled):** This nationwide cached overlay uses a variety of hydrography layers and depicts them in standard USGS Topographic Map symbology. It is updated and re-cached once yearly. It is useful for adding hydrography over other map layers down to 1:9,000 scale. It draws more quickly and is more reliable than the dynamic layers, but is updated less frequently and does not provide access to attributes nor the ability to change the style in other applications. This service is also available as a WMTS.
- **National Hydrography Dataset (NHD):** This nationwide dynamic service displays the NHD High Resolution at scales from 1:288K and below. NHD symbology is used and it includes all symbols, for example, flow direction and connectors are shown at large scales. It draws more slowly than the tile cached service, but the data is updated quarterly and it supports access to attributes and dynamic styling (the ability to change the style representation in ESRI clients). This service is also available as a OGC Web Map Service (WMS).
- **Watersheds (WBD):** This nationwide dynamic service displays the WBD at scales from 1:18M and below. It provides ability to either show all WBD levels at all scale ranges or the most appropriate HUC level at a given scale (default setting). The data is updated quarterly and it supports access to attributes and dynamic styling (the ability to change the style representation in ESRI clients). This map service is also available as a OGC Web Map Service (WMS) and a Web Feature Service (WFS).

Some of the files on this page are presented in Portable Document Format (PDF); the latest version of Adobe Acrobat Reader or similar software is required to view it. [Download the latest version of Acrobat Reader, free of charge.](#)
